OBJECTIVE

Cloud and DevOps Professional with nearly 2 years of experience in application deployment and core infrastructure solutions for AWS and Google Cloud. Proficient in Linux OS and cloud infrastructure components, with a strong focus on optimizing operational efficiency and implementing best practices. Responsible for determining the best platforms, DevOps strategies, and architectures by interacting with business stakeholders to understand business strategy, scenarios, gaps, and issues.

EXPERIENCE

AVASOFT

30-01-2023 – 22-10-2024

Cloud and DevOps Engineer

1. Designed and implemented secure CI/CD pipelines using Azure DevOps, Git, and GitLab, ensuring that applications are built and deployed with security best practices.
2. Managed Linux-based server configurations and automated provisioning processes using tools like Terraform and AWS CloudFormation
3. Integrated automated security testing tools, reducing the average number of vulnerabilities detected in production.
4. Integrated monitoring solutions, improved incident response time through proactive alerting and root cause analysis for operational incidents.
5. Worked collaboratively with cross-functional teams, including development and application support, to optimize cloud resource usage.
6. Developed and maintained shell scripts for automation and task management in disaster recovery processes, ensuring efficient operations across the cloud infrastructure.
7. Provided on-call support for production deployments, managing service requests and incident resolutions via ticketing systems like ServiceNow and Jira.

EDUCATION

- Dhirajlal Gandhi College of Technology
2019 - 2023
Bachelor's degree in Electronics and Communication Engineering
8.2

SKILLS

- **Cloud Platforms:** AWS, GCP
- **Containerization & Orchestration:** Docker, Kubernetes
- **Serverless:** Lambda, Elastic Beanstalk
- **Security Tools:** GitLeaks, SonarQube, Trivy, OWASP ZAP and Depedency Check, CSPM
- **Monitoring Tools:** Logz.io, CloudWatch
- **Configuration Management:** Ansible
- **Infrastructure Automation:** Terraform, AWS CloudFormation
- **Scripting Languages:** Bash

PROJECTS

- **DevOps Engineer**

Technologies: AWS, GitLab

The client was one of the E-comm Rent-to-Own company (that supplies Furniture, Electronics, Electrical Appliances, Smartphones, Computers, and jewelry) in the US who had an on-premises datacenter, Azure and AWS environment which was required to be managed.

1. Implemented an end-to-end solution architecture for deploying a webapp and headless application on a single frame for having the application for end users as Webapp.
2. Infra deployment - To deploy resources in AWS using the CF template and using the console. Support a change management process.
3. Ticket Management - Handling DevOps tickets (Service Now) and Jira.
4. Setting up new projects into GitLab CI/CD.
5. Ad-hoc requests from the Client development team for application support, Integration, Okta, Data Science.
6. Hot fix in deployments, CI/CD. Suggesting best practices for the existing setup.
7. On-Call Support for production deployment.
8. Jenkins to GitLab Migration.
9. Experienced in configuring individual runners for GitHub.

- **DevSecOps Engineer**

Technologies: AWS, Azure, Azure DevOps, Security tools.

The client was one of the NextGen products and solutions company with 14+ years of industry excellence in US, Canada and India who had an on-premises datacenter, Azure and AWS environment. The client asked us to setting up the end-to-end automated Secure deployments by integrating security tools on their NextGen products.

1. Implemented an end-to-end automated secure deployment by integrating security tools into their NextGen products, which ensures that their products are secure.
2. Integrate security tools into NextGen product development pipeline for automated security checks.
3. Enforce DevSecOps governance and compliance standards throughout the deployment lifecycle.
4. Establish initial architecture with vulnerability mitigation strategies.
5. Conduct infrastructure scans to identify security weaknesses and address them proactively.
6. Analyze security check reports and provide developers with remediation steps based on compliance standards.
7. Support a change management process.
8. Suggesting best practices for the existing setup.
