Incident Management:

Orchestrated incident response efforts to promptly detect, respond to, and recover from security incidents. Implemented incident management procedures, conducted post incident reviews, and implemented corrective actions to prevent future occurrences security posture.

Governance, Risk Management, and Compliance (GRC)

Managed governance, risk, and compliance activities to align information security initiatives with business Objectives. Established governance frameworks, conducted risk assessments, and monitored compliance with relevant regulations and standards.

Change management system:

Led and facilitated Change Advisory Board (CAB) meetings on a regular basis to review proposed changes to IT systems, applications, and infrastructure. Evaluated change requests for potential impacts on security, stability, and compliance, ensuring alignment with organizational policies and procedures. Facilitated discussions among stakeholders to assess risks, prioritize changes, and make informed decisions that balanced business needs with risk mitigation strategies.

Change management refers to the actions, tools and models implemented to manage different types of change either at the project or organizational level. Several organizational change management strategies can be applied to manage work, resources, business processes and budget allocations as well as different types of organizational changes.

At the project level, you'll need to set up a change management strategy or framework that guarantees that all changes to the project plan are properly approved, implemented and tracked so that the project timeline, budget or resources are not affected by any sudden changes made to the initial scope, schedule or budget baseline.
