Summary

Highly motivated professional with a robust educational foundation in both Data Science and Software Engineering. My unique skill set, seamlessly integrating expertise in Data Science and Software Engineering, positions me as a versatile and innovative contributor in the field of computer science.

Education

Dhirubhai Ambani Institute of Information and Communication Technology 2022 – 2024
M.Tech. in Machine Learning CPI:7.39

Bhilai Institute of Technology, Durg 2017 – 2021
B.Tech. in Information Technology CPI:8.54

Experience

Clomotech Private Limited june 2024
Machine Learning Consultant
Worked on product ScripsAI

I have reviewed various research papers in the time series domain, implemented the methodologies, trained and validated the models, and set them up for deployment.

Knowledge Gate Eduventure - LLP June 2021 – July 2022
Content and Tech Writer- Machine Learning Hybrid

I collaborated with educators and designers to understand feature requirements and designs, contributing to the creation of accurate documentation. I played a vital role in analyzing and preparing performance reports, offering valuable insights into user experiences. This role honed my skills in collaborative communication, documentation, and data analysis in a dynamic hybrid work environment.

Seed IT Solution, Bhilai May 2019 – August 2019
Vocational Training Bhilai, Chhattisgarh

During my vocational training at Seed IT Solution, Bhilai, I undertook the responsibility of developing and implementing a user-friendly alert system. This involved utilizing embedded C programming with a focus on IoT concepts. Engaging in the end-to-end development process, from conceptualization to execution, I coded in embedded C to facilitate seamless communication between devices. Leveraging IoT principles, I ensured efficient data exchange and real-time monitoring. Additionally, I integrated sensors and actuators to enhance the alert system's responsiveness and reliability.

Technical Skills

Languages: C/C++, Python, HTML/CSS, SQL

Developer Tools & IDEs: Jupyter-Notebook, Google-Colab, Visual Studio Code.

Technologies/Frameworks: Git/ GitHub, Plotly, Scikit-Learn, Matplotlib, Pandas, NumPy, TensorFlow, Keras.

Cloud PlatformMicrosoft Azure

Knowledge of Core Subjects: Machine Learning, Deep Learning, Natural Language Processing, Information Retrieval, Operating Systems.

Teaching Assistant (TA)

August 2022 – Present

As a Teaching Assistant (TA), I played a crucial role in supporting the teaching and learning process, collaborating closely with professors and instructors to enhance the academic journey of students. In my first semester, I served as a TA for “Language and Literature” under Prof. Amishal Modi for B.Tech first-year students. This involved conducting labs and tutoring a sizable batch of 360 students, ensuring a clear understanding of the covered concepts. In subsequent semesters, I took on the role of a TA for “Software Engineering” (IT-314) under Prof. Saurabh Tiwari for B.Tech Pre-final year students. My responsibilities included conducting quizzes, labs, and tutoring, as well as grading assignments, providing constructive feedback, facilitating discussions, and group work, and offering mentorship and support to students.

Technical Projects

Multi-class fake news detection using IR Models | *Python*

October 2023

In October 2023, our project focused on combating the rising tide of fake news in the digital realm. We aimed to assess the efficacy of advanced language models—specifically GPT-2, Recurrent BERT, and RoBERTa—in detecting fake news within the English language context. Leveraging the transformative capabilities of models like BERT and RoBERTa, we scrutinized their performance, ultimately finding that GPT-2 exhibited superior classification abilities for English news. Our evaluation extended to practical application, testing the model on news from the Politifact website, where it demonstrated moderate effectiveness according to the “truth-o-meter.” This work contributes to the ongoing endeavors to enhance fake news detection using state-of-the-art language models.

Probabilistic Forecasting using deep learning models | *Python*

July 2023

In this project, we addressed the challenges presented by the chaotic and uncertain nature of real-world time-series data. Recognizing the limitations of single-point forecasts in capturing the inherent complexities, our objective was to enhance reliability by obtaining a narrow interval for future value estimation. Leveraging deep learning models in Python, we focused on quantifying uncertainties within the data. The methodology involved advanced techniques to navigate the chaotic and random aspects of the time-series data, ensuring a more accurate and nuanced forecasting approach.

Collaborative-based recommendation system on Movie lens dataset(100k) | *Python*

February 2023

I undertook the development of a collaborative-based recommendation system using the Movie Lens dataset (100k) with the primary goal of analyzing and evaluating data within the movie domain. The project involved the creation of a collaborative system, encompassing the writing of code and utilizing exploratory data analysis (EDA) techniques to extract valuable insights from the MovieLens dataset. Through this initiative, the aim was to enhance the understanding and utilization of collaborative filtering methodologies for effective and personalized movie recommendations.

Classification on MNIST-fashion dataset | *Python*

October 2022

In October 2022, I engaged in a project focused on image classification using the MNIST-Fashion dataset. The objective was to design a robust model incorporating various layers to extract features from images and facilitate accurate classification into distinct fashion categories. Employing a convolutional neural network (CNN) architecture, the project aimed to leverage the power of deep learning to enhance the model’s ability to discern intricate patterns within the dataset, contributing to effective and precise classification outcomes.
