Professional Summary

Results-driven Junior Data Engineer with over 2 years of experience in designing and implementing scalable data solutions. Skilled in ETL pipeline development, data modeling, and data warehousing using Snowflake and AWS cloud environments. Proficient in SQL, Python, and data transformation frameworks like dbt. Proven track record of optimizing workflows and enhancing data accessibility for business intelligence. Adept at automating processes and improving data quality to drive actionable insights.

Core Competencies

- **ETL/ELT Processes** | **Data Modeling** | **Data Warehousing** | **Data Pipelines**
 - **Cloud Platforms:** Snowflake, AWS
 - **Programming Languages:** SQL, Python
 - **Data Transformation Tools:** dbt, Airflow
 - **Version Control:** Git, GitHub, GitLab
 - **Databases:** Snowflake
-

Professional Experience

Junior Data Engineer

Alfred Software Private Limited – Bangalore, Karnataka

June 2022 – Present

- Designed and optimized ETL pipelines to process high-volume data, achieving 25% faster load times.
- Architected and implemented Snowflake-based data warehouses, improving analytics capabilities and data retrieval efficiency for business users.
- Collaborated with analysts to transform complex raw datasets into actionable, business-ready insights.
- Automated data transformations using dbt, improving data quality by 15% and streamlining processes.
- Integrated Airflow for workflow orchestration, reducing pipeline downtime and eliminating manual intervention.
- Conducted performance tuning on data models and queries, reducing query execution times by 20%.

Education

Bachelor of Engineering (Civil)

Adichunchanagiri Institute of Technology, Chikamagalur, Karnataka

Graduated in 2022

Projects

E-Commerce Sales Analytics

Objective: Developed an automated data pipeline to process and analyze e-commerce sales data using Snowflake, AWS, and Python, providing real-time insights through Medallion Architecture.

Key Responsibilities:

- **Data Ingestion:** Used Python (Boto3) to automate the upload of sales data from local sources to AWS S3. Configured Snowpipe to ingest data from S3 into Snowflake for real-time processing.
- **Data Cleaning and Transformation:** Implemented data cleaning using Python and SQL in Snowflake, including handling missing values, removing duplicates, and enriching data (e.g., calculating profit margins).
- **Data Modeling:** Designed fact and dimension tables in Snowflake using star schema, optimizing for fast queries and reports.
- **Automation:** Automated data workflows using Python and Snowflake Tasks, ensuring continuous data updates and processing.
- **Reporting:** Generated insights like sales trends, top-performing products, and customer segmentation using SQL queries in Snowflake.

Technologies Used:

- Python (Boto3), SQL, AWS (S3, Snowpipe), Snowflake, Medallion Architecture
