

WORK EXPERIENCE

Cognizant Technology Solutions Pvt Ltd, Hyderabad, India

Jan '22 – Present.

Associate, DevOps Engineer

- Developed and maintained CI/CD pipelines using **Jenkins, Cloud Build** to automate the build, test, and deployment processes.
- Automated infrastructure provisioning and configuration management using Ansible and CloudFormation. Containerized applications using **Docker** and deployed them to **Kubernetes** clusters for scalability and reliability.
- Automated repetitive tasks to improve **efficiency** and reduce the risk of operational errors.
- Successfully introduced a configuration management strategy using **Terraform & Ansible** reducing system downtime by **50%**.
- Completed resource provisioning using IAC tools using **Cloud Formation** or **Terraform**.
- Monitored and maintained system health and performance, ensuring high availability and reliability of services. Troubleshoot and resolve issues related to **infrastructure, networking, and application performance**.
- Created pipelines in **Jenkins** to automate **CICD** workflow and used CICD monitoring tools like **Prometheus, Grafana** to keep track of the application usage and improved system uptime **by 25%**.
- Implemented and managed infrastructure as code (IaC) using tools like such as **Terraform, Ansible to provision infrastructure**. **Participated** in on-call rotation to provide support for critical systems and applications. Collaborated with teams to **design** and **implement** scalable and manageable infrastructure.
- Automated deployment pipelines using Code Pipelines and Jenkins, reducing deployment times by 60%.
- Using **Helm** charts as package manager for Kubernetes deployments and **Argo CD** as CD tool to maintain infrastructure for Kubernetes.
- Developed and maintained **automation scripts** to manage cloud infrastructure using **python, bash** reducing **manual intervention** by **50%** and improving **system uptime** by **45%**
- Deploying applications **on Kubernetes** cluster by heavily deploying nodes.

Associate, Production Support

Oct '20 – Jan '22

- Research and case resolution, incident analysis and diagnosis, configuration maintenance to ensure operations of critical systems and software applications.
- Provided support and maintained the production systems to ensure smooth operations of business-critical applications, creating valuable tools for diagnostic analysis recommending and implementing solutions to mitigate issues.
- Reviewed, monitored and augmented IT reports, dashboard and metrics related to infrastructure, service delivery and customer satisfaction; and recommended process improvement/workflow automation solutions.

TECHNICAL SKILLS

Cloud Platforms: Amazon Web Services (AWS): IAM, EKS, EC2, S3, Cloud Watch

Google Cloud Platform (GCP): Cloud Run, GKE, Cloud Functions, GAE, Cloud Logging etc.

Solid understanding of containerization tools: such as Docker and Kubernetes**Familiarity with CI/CD tools** such as Jenkins as CI, Argo CD as primarily Deployment Tool.**Proficiency in Python and Bash** scripting to automate tasks**Version Control System tools:** Git, GitHub Actions**Monitoring & Logging:** Prometheus, Grafana.**Operating Systems:** Linux shell, Windows**Networking Concepts:** TCP/IP, DNS and HTTP, VPC, WAF, Cloud Amour.

EDUCATION

Girija Nanda Chowdhury Institute of management and Technology, Guwahati

Sept 2020

Bachelor of Technology (B.Tech), Electronics and Communication Engineering

8.5/10

PROJECTS

- Multi-Stage CI/CD Pipeline for E-commerce Application:

Description: Developed and implemented a multi-stage CI/CD pipeline using Jenkins and AWS Code Pipeline to automate the build, test, and deployment processes for an e-commerce application.

- Set up monitoring and alerting systems to track the performance and health of applications and infrastructure:

Description:

Monitoring and alerting systems to track the performance and health of applications using tools like Prometheus, Grafana.

- Optical Character Recognition using OCR using **Python**: Develop an image processing System based on an OCR system which converts image as input to texts and MP3.
- Building war file for the web application hosted in GitHub using maven build plugin and maven project in Jenkins and deploying to container using Jenkins – Apache tomcat server.

Description:

As Jenkins helps in build process so created a war file as it's a web application and using maven build, building the war file and using deploy to container in build options and deploying Apache tomcat server and also using Poll SCM to trigger build automatically if changes are initiated in GitHub.- <https://github.com/priyanka235262/Devops/>

- Push docker image to docker hub using Jenkins pipeline (Jenkins push docker image to docker hub or Jenkins pipeline to deploy docker image or build and push docker image Jenkins). This project also shows how to build Jenkins ci cd pipeline (Jenkins pipeline docker build and push or Jenkins pipeline to create docker image and push to Docker hub).

Description:

Using Jenkins pipeline for various stages via project created on Jenkins and integrated it with webhook to trigger build. By this way we can create the Jenkins CICD pipeline and configure it to build the image into Docker hub and then again pull the image from Docker hub and deploy it on agent server> configure automatic triggers into Jenkins!!
