

RAHULSATYASAIKRISHNA PENKEY

Contact: +91-9182761676

Mail ID: rahulsatyakrishna@gmail.com

Skill Summary:

- Software Professional with 2+ years of IT experience in developing complex multi-tiered enterprise applications for web-based and client-server domains.
- Expert hands-on experience in working with as DBA for **Snowflake, Oracle** databases.
- Created and implemented Queries insert, update and delete operation for the **Oracle, Snowflake databases**.
- Experience and knowledge of Object Relational Mapping and relational database systems (Oracle, Snowflake).
- In – depth understanding of **Snowflake** cloud technology.
- In-Depth understanding of **Snowflake Multi-cluster** Size and Credit Usage
- Played key role in Migrating **Teradata** objects into **Snowflake** environment.
- Experience with **Snowflake Multi-Cluster** Warehouses.
- Experience with **Snowflake Virtual Warehouses**.
- Experience in building **Snow pipe**.
- In-depth knowledge of **Data Sharing** in Snowflake.
- In-depth knowledge of Snowflake Database, Schema and Table structures.
- Experience in using Snowflake **Clone** and **Time Travel**.

PROFESSIONAL EXPERIENCE:

- Working with **MOBILE PROGRAMMING, Pune** from March-2024 to Aug 2024.
- Worked with **COGNIZANT TECHNOLOGY SERVICE IND LTD, HYD** from Oct-2021 to June-2023.

Project I:

Client: Amdocs India

Project: Data Migration (Teradata to Snowflake)

Domain: Telecommunications

Tools & Technologies: Snowflake, Teradata, Putty

Role: DWH/BI Developer

Project Summary:

Worked on transformation and modernization of Enterprise Data Warehouse (EDW) consisting of customer billing information. Moved data warehouse from onprem Teradata to snowflake cloud services using azure as the cloud storage provider. Upgraded code from Mainframe COBOL to Linux Kornshell scripts. Performed data stability and accuracy maintenance activities by triaging tickets raised by the client. Efficient report generation for clients using smartscan tool to ensure data integrity throughout the migration process.

Teradata has been a popular on-premise database system for decades, catering to enterprises who want to manage and analyze large volumes of data. But the advent of Snowflake, a modern cloud computing data warehouse, has opened up modern data analytics capabilities. For example, Snowflake's multi-cluster cloud infrastructure that separates compute from storage enables enterprises to automatically and instantly scale their infrastructure.

Roles and Responsibilities:

- Working on Teradata to Snowflake migration project, where Azure VMWare is used as cloud Provider
- Working on Initial load of data from Teradata to Snowflake.
- Comparing Dev Scripts and Prod Scripts.
- Used Temporary and Transient tables on diff datasets.
- Used copy command to load the bulk data.
- Created Snowpipe for continuous data load.
- Testing the Scripts in Dev before Executing in Prod.

- Checking Schedules in TWS and put it in Hold.
- Creating schedules for jobs.
- After Loading the data into Prod Compare the Count of Teradata & Snowflake data.
- Executed a historic, onetime load to move all the existing data. Setting up ongoing incremental load to collect new data
- Extracted data file from BTEQ, MLOAD and loaded into snowflake.
- We have TWS server where the jobs run after deployment after 3 success run, we handover the tables to operations team.
- Resolve the Initial Load Issues.
- Once deployment in production is done collected tickets based on that we do fixes.

Project II:

Client: AbbVie

Project: Data Migration (Teradata to Snowflake)

Domain: Healthcare

Tools & Technologies: Snowflake, Tosca

Role: Programmer Analyst

Project Summary:

A significant part of what data engineers do is move around data from one database to another – also called data replication and migration. Each data team has gone through a data replication project like this – whether it's to move data to a database better suited for analytical querying, shielding an available database from the high analytical load, or doing a cloud migration process. The data team usually does this through a data replication from Teradata to Snowflake. Let me walk you through a brief introduction to Snowflake. As you would have heard, Snowflake is a data cloud platform. It is presented as a true Software-as-a-Service (SaaS) – no hardware to configure, no software to install, and no maintenance. However, the transition from Teradata to Snowflake is not an easy one click switch. Invariably an enterprise would have built ETL pipelines to push data to Snowflake.

Roles and Responsibilities:

- Creating Tables in snowflake
- Loading data from stage to Snowflake Tables.
- Added Cluster key to the tables.
- Created internal and external stage and transformed data during load.
- Comparing Postgres tables and snowflake tables.
- Running the scripts in Tosca (API Testing) and take the reports.
- Creating Modules and Testcases in Tosca.
- Performance tuning in snowflake.
- Analysis the Root cause of the issue and resolved the Tickets.

ACADEMIC DETAILS

Bachelor of Technology in Mechanical Engineering from JNTU Kakinada.
