OBJECTIVE

Dedicated Django Backend Developer with a proven track record in designing and implementing robust RESTful APIs. Adept at data analysis using Pandas and NumPy , basic Machine Learning Algorithms Seeking opportunities to contribute technical expertise and data science related innovative projects and enhance organizational efficiency.

EDUCATION

SKILLS

- Programming language Skills: 1.Python. 2.Django 3.Machine Learning 4.Pandas 5.Numpy 6.sql 7.botpress
- Python Libraries: Pandas, Numpy,Scikit learn,Matplotlib, Requests, Boto3, Sys, Collections,Regular ,Expressions, Os, Math, Flask, Nltk,Tkinter ,MySQL connector, Socket Threading , API Development: Proficient in designing and implementing RESTful APIs using Django Rest Framework
- IDEs Visual Studio Code, Pycharm, Jupyter Notebook, GUI of Database Management:Skilled in PostgreSQL for data storage, handling complex ORM queries, MySQL Ui
- Data Analysis:Proficient in Pandas and NumPy for data handling, cleaning, and analysis. Os Platforms: *Linux(Ubuntu) *Windows
- Version Control:Proficient in Git for collaborative development.
- Genai used open ai apis for parsing resumes extracting important dataset from out of it by promoting, creating job description with content for job like questions, roles responsibility
- NLP using g then libraries like gpt, spacy, nltk creating algorithm to extract details from a resume. Recommendation algorithm using python libraries

EXPERIENCE

- **Python & Django Developer with Expertise in Backend Development,RESTful APIs and Data Analysis**
Backend Development (Python & Django, Machine Learning, GenAi,sql):
Used python and django,SQL, python libraries in various projects to create a backend structure, database handling with SQL and ORM backend, basic HTML pages connect with django, web scraping, loading the data into db, django admin panel changes filters

Django Rest Framework (DRF):
Created lot of complicated and small APIs such as ,search APIs with url path extension, token authentication, permission classes for apis, authentication class, Signal's trigger, celery for multi task, pagination...etc created using django rest framework

Data Analysis (Pandas & NumPy, SQL):
Used SQL, Pandas to read and fetch data, drop null rows, replacing null rows, creating new columns,mapping, finding correlation,min, max, mode,comparison based , group by filter, aggregate,...etc. Numpy used to created two or dimensional matrix multiplication array multiplication....etc i added

Additional Python Libraries:
Utilized Python libraries such as Requests, BeautifulSoup, and HTML for web scraping and data extraction.

Applied Linear Regression and Logistic Regression algorithms for predicting, classification problems

- **NLP & GenAI**

Using the NLP algorithms from gpt,spacy, nltk libraries extracting the important dataset such as name, email, education, Location, experience, price, role...etc

Using the open ai apis prompting the results of information by sending a content and scrap it which is extracted from mongodb using pymongo

INTERESTS

- Learning New Technologies
- Making Sense out of the dataset
- Teaching

PROJECTS

10-08-2021 - 25-07-2023

- **Python Django developer**

Deductive clouds

Project 1: Aqua culture:

To calculate a farm's each ponds cycle harvesting of fish or prawns, spend food and probiotics quantity, each days fish measure, at the cycle is profit or loss graph, what is the fish seed company feed and probiotics company, each of them connected based on that generating the report for a pond or a farm using ML algorithms, python, SQL ,using django as a backend developer i created this website

Project 2: Chabsons:

To show case all the products like pipes closets, bath taps, basins, tiles,...etc i created backend APIs for product, main category, subcategory,product, rating, search, filter, using django and SQL complex ORM queries,using ML algorithms like Linear regression and logistic regression I have given expected delivery date, customer, products recommendations algorithms

01-05-2024 - 30-11-2024

- **Python ML developer – NLP, Gen AI, Machine Learning (generating recommendation engine for candidates)**

Zinghr–MyrCloud

Using python libraries Transformer, spacy, nltk, vectorizers extracting the details from a resume content

Using the machine learning algorithms loading the job details as training data to recommend the jobs based on skills, exp, location...etc

Creating job description such as Roles and responsibilities, interview questions,...etc using open ai api calling...etc

25-07-2023 - 23-02-2024

- **Python Django developer**

Pacewisdom

Project 1: Let's Optimize Self Discover

The project that evaluates the employee performance for an organisation which part he needs improvement. We calculate based on the conducted assessments for the employee based rated by the organisation people's such as manager, team mates relations. Using those values we generate various types of the reports such as development plan, year based report for improvements, group reportsetc. Using python, Django, in depth orm and SQL queries to generate the API for the reports, data science and ML Algorithms techniques

Project:2:Timeportal

Used to give employee time sheet to track every day work, goals setting to learn by some time, skillset, technology he learned over the time, manager approval, rating, attendance , leave apply...etc tracking website, as a backed developer worked python django, APIs, complicated ORM queries SQL, HTML I used in this project

14-5-2024 - Current company

- **Developer**

Innowave

As a python developer

I used to write python script to automate test script for mobile and stb testing with the new testing framework
