SKILLS

- **Programming:** Java (core), Python, HTML
- **Tools:** Git, AWS (Apache Kafka), Tomcat, PostgreSQL, MySQL

PROJECTS

• Full Stack Bike Showroom Web App.

DBMS

NIE

Nov 2020 - Jan 2021

- The project bike showroom management system, database project that encompasses various companies of bikes along with their specifications, special features and pricing.
- The web application also has an option to book a test ride at the convenience of the user. The user also has an option to view the on road pricing of all the bike models. This project brings together a lot of high end bikes under one application.

• Structured Detail Extraction of Govt Doc Image

Python, Java, Tesseract engine, OpenCV

NIE

Dec 2021 - July 2022

- Text recognition has been one of the active and challenging research areas in the field of image processing and also in context of pattern recognition. This project presents a method to extract various important data from government documents and store it in a JSON file and link different documents of a person so that different data can be used when required.
- The approach taken here is that first the user will have to upload the scanned copy of the document into the GUI and the data is extracted from the photo.
- It is made sure to capture all the necessary data from the image so that even if some of the data in the image is in circular shape, the software captures all the data and from the captured data, we select the important data and store it in a JSON file.
