Work History

Jan 2023 **Senior RPA Developer**
Jan 2025 *Hindustan Coca-cola Beverages (HCCB)*

- Work with Business Analyst to develop high level project plans for RPA implementation.
- Setting up the RPA CoE, Helping in design, Development, Documentation and deployment.
- I was involved in designing, developing, conducting UATs, and deploying these projects using UiPath + Power Automate.
- Created Python scripts for Excel operations in the Cash App process automation since, it is faster compared to UiPath's built-in activities, saving around 40 minutes of execution time.
- Additionally, I developed scripts to interact with databases, SharePoint, OneDrive, Orchestrator, and SAP tables, S3 buckets. I primarily work with libraries such as NumPy, Pandas, pyodbc, requests, msal, win32com, pywin32, tenacity, etc.

1. Cash App process (AR Process)

This project focused on automating the process of handling requests received via email. The bot identifies and processes these requests by performing the appropriate "knocking off" action in SAP, based on the type of request—whether it is a partial knock off or payment knock off. This automation streamlines the workflow, ensuring accurate and timely updates in SAP based on the specified request types.

Roles and Responsibilities:

- Lead the development of automation workflows using UiPath, ensuring they meet business requirements and adhere to best practices for scalability, efficiency, and maintainability.
- Work closely with business analysts, process owners, and other stakeholders
- to understand business processes and translate them into automated solutions.
- Facilitate UAT sessions and obtain necessary sign-offs.
- Create documentation, including PDD, SDD, and BOG (User Manual).

Technologies: UiPath VBA and Python scripts, API Integrations.

2. LKA VC Project:

The customer onboarding process ensures seamless integration of new clients and renewal of existing customers by leveraging detailed data from the P&L statement for financial evaluation. The process begins with gathering essential data such as contract terms, proposed volumes, discounts, and credit periods, which are recorded in an Excel sheet by the sales team. The data undergoes a three-level approval process, with any rejections being sent back for modifications before resubmission. Upon final approval, the finance team drafts an Agreement and facilitates signing between the parties.

Roles and Responsibilities:

- Automated the end-to-end customer onboarding process, including data gathering, validation, and approval workflows.

- Developed scripts to integrate sales data with the P&L statement for real-time financial evaluations.
- Built a notification system to manage rejections, revisions, and resubmissions during the multi-Level approval process.
- Designed and implemented the generation and distribution of final agreements using Automation tools.
- Ensured robust error handling, scalability, and performance optimization of the automation workflows.

Technologies: Power Automate Cloud, Desktop Flows, and Python scripts, API and SQL.

3. NKA Order Processing Bot

This automation project focuses on streamlining the Sales Order (SO) creation process based on Purchase Orders (POs) received via email in various formats (Excel and PDF). The bot reads and updates PO details in a report, checks for duplicity using the PO number, and maps the customer and item codes using predefined references. It validates item codes for capping availability before creating an SO upload format to generate SOs in a blocked stage. Price validation is performed by comparing data from the SalMon report in SAP with the PO details (Basic, MRP, and Landing prices). Line items that pass validation are released for delivery, while those that fail are sent for PO amendment. Delivery dates are updated as per the PO, and at the end of the day, a consolidated PO report is generated summarizing all processed Pos.

Roles and Responsibilities:

- Analyze and understand the requirements, followed by effort estimation.
- Design the solution, develop the system, and perform end-to-end testing.
- Facilitate UAT sessions and obtain necessary sign-offs.
- Create documentation, including PDD, SDD, and BOG (User Manual).
- Provide hyper care support and post-deployment assistance.

Technologies: UiPath Studio, Orchestrator, AiBuilder, Document Understanding, VBA(Macros).

Created a script to monitor the jobs in Running UiPath Orchestrator and do a re- run if any Faulted jobs found (Basically for monitoring purpose).

How it Works:

1. Monitor the jobs in Orchestrator in every 60 sec.
2. Re-run if any Faulted job found and added the details to SP List (Process Name, JobID , Error Details , Machine/System Account etc).
 - A re-run will only occur if the job is new and the faulted job was scheduled,not manually triggered.
 - We also have another SharePoint list where we can specify the Bot Names for which a re-run is not required.
3. Wait for 59 sec and got to Setp:1
4. If the scripts fail then, send an email notification to the corresponding team.

Jul 2021
Jan 2023

Module Lead

Happiest Minds Technologies, Bangalore

Work with Business Analyst to develop high level project plans for RPA implementation. Creating and maintaining the project documents like SDD, Issue trackers, Timeline document Environment details.

Provide RPA operations support and handle RPA/System admin tasks.

Skills: UiPath , Python, SQL

Jan 2020 -
July 2021

Software Engineer

Enquero Global, Bangalore, Karnataka

Experienced in end to end conducting process assessment, designing, coding and testing for automation solutions using RPA tool –UiPath, delivered multiple projects end to end in RPA and has also supported.

Automation Tool Used: UiPath, Python Scripting, Macro,

Dec 2018 -
Dec 2019

Software Engineer I

Concentrix, Bangalore, Karnataka

- Requirement understanding and analysis and effort estimation.
- Proactively designed RPA Tasks as per application and business requirements.
- Developed and implemented new technical solutions for production applications to interact effectively with users.
- Supported ongoing operational bots including bug fixes, enhancements, and performance improvements.

Automation Tool Used: UiPath

Project Name: Employee Reimbursement Process

Summary: Validate the cell phone bills (PDF files) which is uploaded in ERP system and approve or reject the Claim requests according to the result.

Bot will login into the ERP System and extract the Claim_id's which is approved by the corresponding managers. Then filter the records with the country, Expense type. Once it's done search each Claim_id in the web portal and download the cell phone bills (PDF) and read the required values(Name , Bill Date etc) Then validate the data which is mentioned in the system with the extracted info.If all the criteria met, then approve that claim. After completing the entire process, will send an email notification with the output file.

Mar 2016 -
Nov 2018

Software Engineer

Oracle Financial Services Software (OFSS), Bangalore, Karnataka

- Responsible for design & development and automate different modules.
- Automating the manual process of creating Monthly Report by extracting data from Web, Database and Main Frame Application and preparing the report based on the excel calculations and sending a mail with attaching these reports.
- Facilitated with implementation and customization of Flexcube modules across 3 different product versions.
 - Technology Used: Oracle 11g, PL/SQL, UiPath

Education

Jan 2015

MCA

Cochin University of Science and Technology (CUSAT)

GPA: 1

Jan 2011

BSc: Mathematics

Mahatma Gandhi University
