Summary

As a highly skilled professional with **3 years** of hands-on experience in network protocols and a proven track record in **C++** programming, along with expertise in TCL scripts and **XML parsing**, my goal is to leverage this comprehensive skill set to design, implement, and optimize cutting-edge 5G solutions and network protocols. With an in-depth understanding of standalone(**SA**) and non-standalone(**NSA**) features of 5G, including ENDC, I aim to contribute to leading innovation in the Network industry. My passion for staying at the forefront of technology, coupled with my drive for growth, efficiency, and excellence, aligns seamlessly with my aspirations for continuous personal and professional development.

Education

Institute Of Engineering and Technology

*Bachelor of Engineering in **Electronics And Communication Engineering***

Jul. 2018 – Sep 2021

Agra, Uttar Pradesh

T.G.B. Govt. Polytechnic

*Diploma in Engineering in **Electronics Engineering***

Jul. 2015 – Aug 2018

Shrawasti, Uttar Pradesh

Experience

AltioStar Networks (Rakuten Symphony)

Nov 2021 – Present

Member Of Technical Staff

Bengaluru

- Working as Platform Developer on the Control Plane side (signalling), specializing in Control Plane simulation and NGCU capability validation.
- Proficient in C, C++, TCL scripting, Linux, and Wireshark for comprehensive analysis.
- Working with the NRDU Simulation Team to simulate Control Plane operations, enabling message exchange among NRDU, NGCU.
- **F1C Messages** : Handling control plane messages which consists of F1C messages (F1setup Req, F1setup Resp., Ue Ctx Setup Req, Ue Ctx Setup Resp).
- **F1 Reset**: Whenever reset message came from ngcu we'll delete UE ctx. In this we have two type of reset Partial Reset and Full Reset.
- **ASN.1 Encoder and Decoder**: Encoding and Decoding all the F1C Messages.
- **Handovers**: Facilitated ENDC and SA handovers, with max. success rate in Non-Standalone and Stand Alone transitions.
Developed and Implemented LTE and NR Handover Features: Led the design and execution of LTE handover solutions with NR continuity and NR release, improving handover success rates by **30%** and reducing latency by **25%**.
Optimized Network Performance: Enhanced network performance and reliability by **20%**, achieving **85%** improvement in handover reliability and **15%** boost in overall network stability.
Facilitated Knowledge Transfer: Created detailed documentation and conducted knowledge transfer sessions, increasing team alignment and feature adoption by **40%**.
Achieved Impactful Results: Improved user experience and network efficiency, contributing to a **15%** increase in customer satisfaction and **10%** reduction in service interruptions.
- **Statistics**: Implementation of message display exchange between NRDU - NGCU for user interface which helps in getting failure/success information easily.
- Additionally, I provide development support for our customers.

Internship

Softpro India Pvt.Ltd.

Jul 2020 – Sep 2020

Anti Robbery Smart Bank Lock System, Intern

Lucknow, Uttar Pradesh

- * Developed anti-robber smart bank locker system in C Programming, ensuring robust and efficient code.
- * Integrated Raspberry Pi hardware components to enhance the system's functionality, such as camera modules and sensors.
- * Demonstrated an understanding of Python programming and Raspberry Pi hardware integration in a real-world, high-stakes application.

Projects

Laser security System | *LDR, LASER*

Jan - July 2018

- * Developed a laser-based security alarm system to address historical installation challenges and increase accessibility for a wider range of individuals.
- * Designed a residential laser security system with a central alarm unit and infrared motion detector, utilizing laser light and Light Dependent Resistors (LDRs).
- * Selected laser technology for its long-distance coverage capabilities without dispersion, improving the system's effectiveness as an intermediary between source and destination. - Conducted analysis of the laser source using LDRs to enhance system functionality.

Home automation | *GSM Module, Arduino UNO*

Jan - July 2021

- * Implemented a GSM based home automation system to address challenges of short distance automation and energy wastage - Developed hardware modules (power supply, GSM, microcontroller, relays, and loads) and programmed system controller.
- * Utilized SMS commands to remotely control electrical devices.
- * Successfully tested system's effectiveness in remote control of appliances, with an average delay of 19 seconds before switching occurs.

Technical Skills

Languages: C/C++, OOPS, STL, TCL Script, XML.

Operating System: Linux , Windows.

Software/Tools: Git, VNC, GDB, Wireshark, Mobaxterm, VisualStudio, Jira, Jenkins, Pycharm, Docker, Kubernetes, Putty, Xshell, Atmel Studio.

Teck Stack: TCP/IP Model, F1AP Protocol, SCTP, UDP, TCP, LTE, SA, NSA, Operating System, Design Patterns, Data Structure, Algorithms, Multithreading, Socket Programming, UE Stack Protocols, Computer Networks

Certificates

Certificate 1: Introduction in Internet of things by CISCO.

Certificate 2: Conceptual Knowledge developed for (C/C++) by FindRED

Certificate 3: Python For Everybody by Coursera.

Certificate 4: National conference at Recent Advance in Electronics and Communication Engg. presented paper on Home Automation Using GSM Module Using Arduino UNO.
