

Keerthana V

PROFILE SUMMARY

Enthusiastic and knowledgeable cloud computing professional with hands-on experience in AWS and Azure platforms, seeking an entry-level role to leverage my understanding of cloud infrastructure and services. Skilled in network management, virtual machines, storage solutions, IAM (Identity and Access Management), and Active Directory. Experienced in backup and restore services and knowledgeable in cloud migration strategies. Eager to contribute to a forward-thinking team and enhance cloud infrastructure efficiency and security

EDUCATION

- 2023

M.Tech
G Pullaiah College of Engineering and Technology, Kurnool
- 2020

B.Tech/B.E.
Ravindra College of Engineering for Women, Kurnool

Projects

- 6 Months

Brain Image Fusion Using Recurrent Neural Network

Image fusion is the process of combining multiple images into a single image called fused image so that much information can be extracted from the resultant fused image without introducing artefacts. There are various image fusion techniques available such as average, wavelet transform, shear let transform, fuzzy logic etc.in this project mainly focuses on the Fuzzy logic system in the digital image processing .it is used in natural, satellite, medical and much more areas. It is one of the decision-making methods of artificial intelligence. Fuzzy logic has been confirmed to be relevant in almost all systematic fields.In MIF techniques the fuzzy logic is used for contrast reduction, loss of image fine details and unwanted image degradation etc. subjective and objective evaluation show better performance of this new approach compared to existing techniques

Prominent Speed Low Power Compressor Based Multiplier For Proficient VLSI Architecture

In recent years the computational units are optimized to reduce computation time. Multiplier is an electronic circuit used in digital electronics and has significant role in VLSI applications. The 4-2 compressors has 5 inputs A, B, C, D and Cin to produce 3 outputs as sum, carry and Count. Each of these compressors has its own level of accuracy as well as different delays and power dissipations. The efficiencies of these compressors are used in another type of multiplier (other than Dadda multiplier) are evaluated in 45 nm standard CMOS.

COURSES & CERTIFICATIONS

- Journal Of Systems Engineering And Electronics
- Certificate Of Achievement A Practical Introduction To Cloud Computing
- Network Security Associate Virtual Internship Supported By FORTINET
